The use of artificial intelligence (AI) for writing has progressed from helping businesses complete routine administrative duties to developing professional and high-quality written content that comes with both potential rewards and possible risks (Hutson, 2021). Productivity is increased because AI allows for the automation of repetitive writing tasks; it increases speed; reduces cost; and assists in making decisions in business and education (Dwivedi et al., 2023). Accessibility is improved as well because AI helps those who are non-English speakers or have a disability. There are some risks associated with using an AI writer including inaccurately generated information (fabricated), which creates questions regarding its dependability and quality of decision making (Bender et al., 2021). AI also poses unique problems concerning creative writing such as authenticity, ownership of work, and authors rights as well as diminished abilities to think critically and creatively due to an over-reliance on AI. Furthermore, there exists the possibility for unfair or misleading content produced by AI based on pre-existing biases in the data used to train the AI. Organizations will therefore need to develop and implement responsible governance of their AI systems through continuous human oversight, transparency, evaluation of AI for biases, and validation of all AI-generated written content. The goal of the development of AI writers is to be complementary to human knowledge and expertise, not to diminish human discretion.

Thank you for this well written post that succinctly captures some of the benefits and risks of use of artificial intelligence (AI) for writing. I particularly appreciated the fact that you highlighted how AI writers can improve accessibility for various groups, and I agree with the risks you highlight such as fabricated information and potential sources of bias within the training sets.

Your comment highlighting that organisations need to develop and implement responsible governance for AI systems caused me to reflect on a news article I recently read (Fay, 2026) which discusses the drive of many businesses to use AI, resulting in poorly grounded random AI usage targets.

This kind of approach leads to pressure on employees to use tools, such as AI writers despite poor underlying knowledge of several of the issues you highlighted. Additional issues such as plagiarism, erosion of critical thinking and sense of lack of authenticity also exist, which can have detrimental effects for a business, or when used in health care environments, and can lead to a reduction in willingness to trust (Pikhart and Al-Obaydi, 2025; Seitz, 2024).

As stated in your closing sentence, AI writers should be complementary to human knowledge and expertise, and human oversight must remain; thorough education of users is essential to help mitigate the concerns raised.
